A large, spectacular damselfly. Males have a brilliant metallic blue-green body and almost entirely dark blue-brown wings; females are bronze-green with smoky brown wings and a small white spot near the tip. Beautiful demoiselles need fast, clean, stony rivers and burns with sandy or gravelly beds, so their presence is a genuine indicator of good water quality.

BEHAVIOUR

The flight is quite unlike other damselflies — a slow, fluttering, butterfly-like beat, often with the wings held wide. Males hold territories along a stretch of burn and perform a display flight for females, hovering and flicking the wings open to show the dark colour. Larvae live among tree roots and gravel in flowing water for two years before emerging.
